Warm-up Challenge

Problem

Show that the closed ball

$$\overline{B}(\vec{x};r) = \{\vec{y} \in \mathbb{R}^n : |\vec{x} - \vec{y}| \le r\}$$

is a closed set.

We have been studying the beginnings of **point set topology**.

We have been studying the beginnings of **point set topology**. In topology, we start with a set *X* called the **space** and a collection of special subsets called **open sets**.

Answers must be in terms of open sets

Definition

A **open cover** of a set $A \subseteq \mathbb{R}^n$ is a family $\{U_i : i \in I\}$ of open sets with $A \subseteq \bigcup_{i \in I} U_i$.

Definition

A **open cover** of a set $A \subseteq \mathbb{R}^n$ is a family $\{U_i : i \in I\}$ of open sets with $A \subseteq \bigcup_{i \in I} U_i$.

A **subcover** is a family $\{U_j : j \in J\}$ with $J \subseteq I$ which is still covers A, ie. $A \subseteq \bigcup_{j \in J} U_j$.

Definition

A **open cover** of a set $A \subseteq \mathbb{R}^n$ is a family $\{U_i : i \in I\}$ of open sets with $A \subseteq \bigcup_{i \in I} U_i$. A **subcover** is a family $\{U_j : j \in J\}$ with $J \subseteq I$ which is still covers A, ie. $A \subseteq \bigcup_{i \in J} U_i$.

Examples:

Definition

- $\{(0, 1/2), (1/2, 2)\}$ is an open cover of the interval (0, 1]
- $\{(\frac{1}{n}, \frac{n+1}{n}) : n \in \mathbb{Z}_+\}$ is an open cover of (0, 1]

Lindelöf Covering Theorem

Theorem (Lindelöf Covering Theorem)

Let $A \subseteq \mathbb{R}^n$ be a set and suppose $\{U_i : i \in I\}$ is an open covering of A. Then there exists a countable subcover $\{U_j : j \in J\}$.

Lindelöf Covering Theorem

Theorem (Lindelöf Covering Theorem)

Let $A \subseteq \mathbb{R}^n$ be a set and suppose $\{U_i : i \in I\}$ is an open covering of A. Then there exists a countable subcover $\{U_j : j \in J\}$.

Question

Can we do better than this?

Lindelöf Covering Theorem

Theorem (Lindelöf Covering Theorem)

Let $A \subseteq \mathbb{R}^n$ be a set and suppose $\{U_i : i \in I\}$ is an open covering of A. Then there exists a countable subcover $\{U_j : j \in J\}$.

Question

Can we do better than this?

Definition

A set $A \subseteq \mathbb{R}^n$ is called **compact** if every open cover of A has a *finite* subcover.

Problem

Show that a singleton set $A = {\vec{x}}$ is compact.

Problem

Show that a singleton set $A = {\vec{x}}$ is compact.

Solution

Problem

Show that a singleton set $A = {\vec{x}}$ is compact.

Solution

Suppose that $\{U_i : i \in I\}$ is an open cover of X.

Problem

Show that a singleton set $A = {\vec{x}}$ is compact.

Solution

Suppose that $\{U_i : i \in I\}$ is an open cover of X.

Then $A \subseteq \bigcup_{i \in I} U_i$.

Problem

Show that a singleton set $A = {\vec{x}}$ is compact.

Solution

Suppose that $\{U_i : i \in I\}$ is an open cover of X.

Then $A \subseteq \bigcup_{i \in I} U_i$.

This means that $\vec{x} \in \bigcup_{i \in I} U_i$.

Problem

Show that a singleton set $A = \{\vec{x}\}$ is compact.

Solution

Suppose that $\{U_i : i \in I\}$ is an open cover of X.

Then $A \subseteq \bigcup_{i \in I} U_i$.

This means that $\vec{x} \in \bigcup_{i \in I} U_i$.

Therefore $\vec{x} \in U_j$ for some $j \in I$.

Problem

Show that a singleton set $A = \{\vec{x}\}$ is compact.

Solution

Suppose that $\{U_i : i \in I\}$ is an open cover of X.

Then $A \subseteq \bigcup_{i \in I} U_i$.

This means that $\vec{x} \in \bigcup_{i \in I} U_i$.

Therefore $\vec{x} \in U_j$ for some $j \in I$.

It follows that $\{U_j\}$ is a subcover of A consisting of a single set.

Problem

Show that a singleton set $A = \{\vec{x}\}$ is compact.

Solution

Suppose that $\{U_i : i \in I\}$ is an open cover of X.

Then $A \subseteq \bigcup_{i \in I} U_i$.

This means that $\vec{x} \in \bigcup_{i \in I} U_i$.

Therefore $\vec{x} \in U_j$ for some $j \in I$.

It follows that $\{U_j\}$ is a subcover of A consisting of a single set.

Thus every open cover has a finite subcover, making *A* compact!

We will show that the compact subsets of \mathbb{R}^n are exactly the closed sets that are bounded.

We will show that the compact subsets of \mathbb{R}^n are exactly the closed sets that are bounded.

Definition

A subset $A \subseteq \mathbb{R}^n$ is called **bounded** if there exists $\vec{x} \in \mathbb{R}^n$ and r > 0 such that $A \subseteq B(\vec{x}; r)$.

We will show that the compact subsets of \mathbb{R}^n are exactly the closed sets that are bounded.

Definition

A subset $A \subseteq \mathbb{R}^n$ is called **bounded** if there exists $\vec{x} \in \mathbb{R}^n$ and r > 0 such that $A \subseteq B(\vec{x}; r)$.

Theorem

If A is a compact set, then A must be bounded.

We will show that the compact subsets of \mathbb{R}^n are exactly the closed sets that are bounded.

Definition

A subset $A \subseteq \mathbb{R}^n$ is called **bounded** if there exists $\vec{x} \in \mathbb{R}^n$ and r > 0 such that $A \subseteq B(\vec{x}; r)$.

Theorem

If A is a compact set, then A must be bounded.

Proof.

Suppose A is a compact set.

We will show that the compact subsets of \mathbb{R}^n are exactly the closed sets that are bounded.

Definition

A subset $A \subseteq \mathbb{R}^n$ is called **bounded** if there exists $\vec{x} \in \mathbb{R}^n$ and r > 0 such that $A \subseteq B(\vec{x}; r)$.

Theorem

If A is a compact set, then A must be bounded.

Proof.

Suppose A is a compact set.

Consider the family of sets $\{U_i : i \in I\}$ where $I = \mathbb{Z}_+$ and $U_i = B(\vec{0}; i)$.

Problem

Show that $\{U_i : i \in I\}$ is an open cover of A.

Problem

Show that $\{U_i : i \in I\}$ is an open cover of A.

Solution

Note that U_i is an open subset for all i, so we need only show $A \subseteq \bigcup_{i \in I} U_i$.

Problem

Show that $\{U_i : i \in I\}$ is an open cover of A.

Solution

Note that U_i is an open subset for all i, so we need only show $A \subseteq \bigcup_{i \in I} U_i$.

$$\bigcup_{i\in I}U_i=\bigcup_{i=1}^\infty B(\vec{0};i)\subseteq\mathbb{R}^n.$$

Problem

Show that $\{U_i : i \in I\}$ is an open cover of A.

Solution

Note that U_i is an open subset for all i, so we need only show $A \subseteq \bigcup_{i \in I} U_i$.

$$\bigcup_{i\in I}U_i=\bigcup_{i=1}^\infty B(\vec{0};i)\subseteq\mathbb{R}^n.$$

Moreover, if $\vec{x} \in \mathbb{R}^n$, then we can choose $N \in \mathbb{Z}_+$ such that $N > |\vec{x}|$.

Problem

Show that $\{U_i : i \in I\}$ is an open cover of A.

Solution

Note that U_i is an open subset for all i, so we need only show $A \subseteq \bigcup_{i \in I} U_i$.

$$\bigcup_{i\in I}U_i=\bigcup_{i=1}^\infty B(\vec{0};i)\subseteq\mathbb{R}^n.$$

Moreover, if $\vec{x} \in \mathbb{R}^n$, then we can choose $N \in \mathbb{Z}_+$ such that $N > |\vec{x}|$.

Therefore $\vec{x} \in B(\vec{0}; N)$ and it follows $\vec{x} \in \bigcup_{i \in I} U_i$.

Problem

Show that $\{U_i : i \in I\}$ is an open cover of A.

Solution

Note that U_i is an open subset for all i, so we need only show $A \subseteq \bigcup_{i \in I} U_i$.

$$\bigcup_{i\in I}U_i=\bigcup_{i=1}^\infty B(\vec{0};i)\subseteq\mathbb{R}^n.$$

Moreover, if $\vec{x} \in \mathbb{R}^n$, then we can choose $N \in \mathbb{Z}_+$ such that $N > |\vec{x}|$.

Therefore $\vec{x} \in B(\vec{0}; N)$ and it follows $\vec{x} \in \bigcup_{i \in I} U_i$. Thus $\mathbb{R}^n = \bigcup_{i \in I} U_i$, and since $A \subseteq \mathbb{R}^n$, we see $A \subseteq \bigcup_{i \in I} U_i$.

Problem

Explain what it means that $\{U_i : i \in I\}$ has a finite subcover.

Problem

Explain what it means that $\{U_i : i \in I\}$ has a finite subcover.

Solution

There is a finite subset $\{i_1, i_2, \dots, i_m\} \subseteq I$ with $A \subseteq \bigcup_{k=1}^m U_{i_k}$.

Problem

Show that $\bigcup_{k=1}^{m} U_{i_k}$ is an open ball, and thus A is bounded.

Problem

Show that $\bigcup_{k=1}^{m} U_{i_k}$ is an open ball, and thus A is bounded.

Solution

Without loss of generality, $i_1 < i_2 < \dots i_m$.

Problem

Show that $\bigcup_{k=1}^{m} U_{i_k}$ is an open ball, and thus A is bounded.

Solution

Without loss of generality, $i_1 < i_2 < \dots i_m$. Then

$$B(\vec{0}; i_1) \subseteq B(\vec{0}; i_2) \subseteq \cdots \subseteq B(\vec{0}; i_m).$$

Problem

Show that $\bigcup_{k=1}^{m} U_{i_k}$ is an open ball, and thus A is bounded.

Solution

Without loss of generality, $i_1 < i_2 < \dots i_m$. Then

$$B(\vec{0}; i_1) \subseteq B(\vec{0}; i_2) \subseteq \cdots \subseteq B(\vec{0}; i_m).$$

This means

$$A\subseteq \bigcup_{k=1}^m A_{i_k}=\bigcup_{k=1}^m B(\vec{0};i_k)=B(\vec{0},i_m).$$

Problem

Show that $\bigcup_{k=1}^{m} U_{i_k}$ is an open ball, and thus A is bounded.

Solution

Without loss of generality, $i_1 < i_2 < \dots i_m$. Then

$$B(\vec{0}; i_1) \subseteq B(\vec{0}; i_2) \subseteq \cdots \subseteq B(\vec{0}; i_m).$$

This means

$$A\subseteq \bigcup_{k=1}^m A_{i_k}=\bigcup_{k=1}^m B(\vec{0};i_k)=B(\vec{0},i_m).$$

This shows A is bounded.

Theorem

Suppose that $A \subseteq \mathbb{R}^n$ is compact. Then A is closed.

Theorem

Suppose that $A \subseteq \mathbb{R}^n$ is compact. Then A is closed.

Proof.

Theorem

Suppose that $A \subseteq \mathbb{R}^n$ is compact. Then A is closed.

Proof.

Suppose that *A* is compact and let $\vec{x} \in \mathbb{R}^n \backslash A$.

Theorem

Suppose that $A \subseteq \mathbb{R}^n$ is compact. Then A is closed.

Proof.

Suppose that *A* is compact and let $\vec{x} \in \mathbb{R}^n \backslash A$.

We will show \vec{x} cannot be an adherent point of A and therefore A contains all of its adherent points.

Theorem

Suppose that $A \subseteq \mathbb{R}^n$ is compact. Then A is closed.

Proof.

Suppose that *A* is compact and let $\vec{x} \in \mathbb{R}^n \backslash A$.

We will show \vec{x} cannot be an adherent point of A and therefore A contains all of its adherent points.

Consider the family of sets $\{U_i : i \in I\}$ where $I = \mathbb{Z}_+$ and

$$U_i = \mathbb{R}^n \backslash \overline{B}(\vec{x}; 1/i).$$

Problem

Prove that $\bigcup_{i \in I} U_i = \mathbb{R}^n \setminus \{\vec{x}\}.$

Problem

Explain why $\{U_i : i \in I\}$ is an open cover of A.

Problem

Show that if $\{U_i : i \in I\}$ has a finite subcover, then \vec{x} can't be an adherent point of \vec{A} .

So far, we have seen compact sets are closed and bounded.

So far, we have seen compact sets are closed and bounded. We want to prove the opposite is true too!

So far, we have seen compact sets are closed and bounded. We want to prove the opposite is true too! This will require obtaining some other fundamental results about real numbers.

So far, we have seen compact sets are closed and bounded. We want to prove the opposite is true too! This will require obtaining some other fundamental results about real numbers.

Theorem (Bolzano-Weierstrass Theorem)

A bounded set $A \subseteq \mathbb{R}^n$ with infinitely many points will contain an accumulation point.

Theorem (Cantor Intersection Theorem)

Suppose that $C_1, C_2, C_3, ...$ are non-empty closed, bounded sets with $C_{i+1} \subseteq C_i$ for all $i \in I = \mathbb{Z}_+$. Then $\bigcap_{i \in I} C_i$ is also non-empty.

Theorem (Cantor Intersection Theorem)

Suppose that $C_1, C_2, C_3, ...$ are non-empty closed, bounded sets with $C_{i+1} \subseteq C_i$ for all $i \in I = \mathbb{Z}_+$. Then $\bigcap_{i \in I} C_i$ is also non-empty.

Proof.

Theorem (Cantor Intersection Theorem)

Suppose that $C_1, C_2, C_3, ...$ are non-empty closed, bounded sets with $C_{i+1} \subseteq C_i$ for all $i \in I = \mathbb{Z}_+$. Then $\bigcap_{i \in I} C_i$ is also non-empty.

Proof.

If C_i is finite for some i, then the proof is simple. Assume otherwise.

Theorem (Cantor Intersection Theorem)

Suppose that $C_1, C_2, C_3, ...$ are non-empty closed, bounded sets with $C_{i+1} \subseteq C_i$ for all $i \in I = \mathbb{Z}_+$. Then $\bigcap_{i \in I} C_i$ is also non-empty.

Proof.

If C_i is finite for some i, then the proof is simple. Assume otherwise.

Then choose $\vec{x}_i \in C_i$ for all $i \in I$ all distinct.

Theorem (Cantor Intersection Theorem)

Suppose that $C_1, C_2, C_3, ...$ are non-empty closed, bounded sets with $C_{i+1} \subseteq C_i$ for all $i \in I = \mathbb{Z}_+$. Then $\bigcap_{i \in I} C_i$ is also non-empty.

Proof.

If C_i is finite for some i, then the proof is simple. Assume otherwise.

Then choose $\vec{x}_i \in C_i$ for all $i \in I$ all distinct.

The set $A = {\vec{x}_i : i \in \mathbb{Z}_+}$ is infinite and bounded (because it is contained in C_1).

Theorem (Cantor Intersection Theorem)

Suppose that $C_1, C_2, C_3, ...$ are non-empty closed, bounded sets with $C_{i+1} \subseteq C_i$ for all $i \in I = \mathbb{Z}_+$. Then $\bigcap_{i \in I} C_i$ is also non-empty.

Proof.

If C_i is finite for some i, then the proof is simple. Assume otherwise.

Then choose $\vec{x_i} \in C_i$ for all $i \in I$ all distinct.

The set $A = {\vec{x}_i : i \in \mathbb{Z}_+}$ is infinite and bounded (because it is contained in C_1).

Therefore the Bolzano-Weierstrass Theorem tells us it has an accumulation point \vec{x} .

Theorem (Cantor Intersection Theorem)

Suppose that $C_1, C_2, C_3, ...$ are non-empty closed, bounded sets with $C_{i+1} \subseteq C_i$ for all $i \in I = \mathbb{Z}_+$. Then $\bigcap_{i \in I} C_i$ is also non-empty.

Theorem (Cantor Intersection Theorem)

Suppose that $C_1, C_2, C_3, ...$ are non-empty closed, bounded sets with $C_{i+1} \subseteq C_i$ for all $i \in I = \mathbb{Z}_+$. Then $\bigcap_{i \in I} C_i$ is also non-empty.

Proof by Contradiction.

Theorem (Cantor Intersection Theorem)

Suppose that $C_1, C_2, C_3, ...$ are non-empty closed, bounded sets with $C_{i+1} \subseteq C_i$ for all $i \in I = \mathbb{Z}_+$. Then $\bigcap_{i \in I} C_i$ is also non-empty.

Proof by Contradiction.

In fact, if we let $A_m = \{\vec{x}_i : i \in \mathbb{Z}_+, i \geq m\}$, then \vec{x} is an accumulation point of A_m for all m.

Theorem (Cantor Intersection Theorem)

Suppose that $C_1, C_2, C_3, ...$ are non-empty closed, bounded sets with $C_{i+1} \subseteq C_i$ for all $i \in I = \mathbb{Z}_+$. Then $\bigcap_{i \in I} C_i$ is also non-empty.

Proof by Contradiction.

In fact, if we let $A_m = \{\vec{x}_i : i \in \mathbb{Z}_+, i \geq m\}$, then \vec{x} is an accumulation point of A_m for all m.

Moreover, $A_m \subseteq C_m$ so \vec{x} is an accumulation point of C_m for all m.

Theorem (Cantor Intersection Theorem)

Suppose that $C_1, C_2, C_3, ...$ are non-empty closed, bounded sets with $C_{i+1} \subseteq C_i$ for all $i \in I = \mathbb{Z}_+$. Then $\bigcap_{i \in I} C_i$ is also non-empty.

Proof by Contradiction.

In fact, if we let $A_m = \{\vec{x}_i : i \in \mathbb{Z}_+, i \geq m\}$, then \vec{x} is an accumulation point of A_m for all m.

Moreover, $A_m \subseteq C_m$ so \vec{x} is an accumulation point of C_m for all m.

Since C_m is closed, it follows $\vec{x} \in C_m$, and thus $\vec{x} \in \bigcap_{i \in I} C_i$.

Theorem (Cantor Intersection Theorem)

Suppose that $C_1, C_2, C_3, ...$ are non-empty closed, bounded sets with $C_{i+1} \subseteq C_i$ for all $i \in I = \mathbb{Z}_+$. Then $\bigcap_{i \in I} C_i$ is also non-empty.

Proof by Contradiction.

In fact, if we let $A_m = \{\vec{x}_i : i \in \mathbb{Z}_+, i \geq m\}$, then \vec{x} is an accumulation point of A_m for all m.

Moreover, $A_m \subseteq C_m$ so \vec{x} is an accumulation point of C_m for all m.

Since C_m is closed, it follows $\vec{x} \in C_m$, and thus $\vec{x} \in \bigcap_{i \in I} C_i$. In particular the intersection is non-empty!

Heine-Borel Theorem

Theorem (Heine-Borel Theorem)

A subset $A \subseteq \mathbb{R}^n$ is compact if and only if it is closed and bounded.

Theorem (Heine-Borel Theorem)

A subset $A \subseteq \mathbb{R}^n$ is compact if and only if it is closed and bounded.

Proof.

Theorem (Heine-Borel Theorem)

A subset $A \subseteq \mathbb{R}^n$ is compact if and only if it is closed and bounded.

Proof.

We already proved compact implies closed and bounded.

Theorem (Heine-Borel Theorem)

A subset $A \subseteq \mathbb{R}^n$ is compact if and only if it is closed and bounded.

Proof.

We already proved compact implies closed and bounded. Assume *A* is closed and bounded.

Theorem (Heine-Borel Theorem)

A subset $A \subseteq \mathbb{R}^n$ is compact if and only if it is closed and bounded.

Proof.

We already proved compact implies closed and bounded. Assume *A* is closed and bounded.

Take an open cover $\{U_i : i \in I\}$.

Theorem (Heine-Borel Theorem)

A subset $A \subseteq \mathbb{R}^n$ is compact if and only if it is closed and bounded.

Proof.

We already proved compact implies closed and bounded.

Assume *A* is closed and bounded.

Take an open cover $\{U_i : i \in I\}$.

Then by Lindelöf's Theorem, we can take a countable subcover.

Theorem (Heine-Borel Theorem)

A subset $A \subseteq \mathbb{R}^n$ is compact if and only if it is closed and bounded.

Proof.

We already proved compact implies closed and bounded.

Assume A is closed and bounded.

Take an open cover $\{U_i : i \in I\}$.

Then by Lindelöf's Theorem, we can take a countable subcover.

Therefore without loss of generality, assume $I = \mathbb{Z}_+$.

Theorem (Heine-Borel Theorem)

A subset $A \subseteq \mathbb{R}^n$ is compact if and only if it is closed and bounded.

Proof.

We already proved compact implies closed and bounded.

Assume A is closed and bounded.

Take an open cover $\{U_i : i \in I\}$.

Then by Lindelöf's Theorem, we can take a countable subcover.

Therefore without loss of generality, assume $I = \mathbb{Z}_+$.

Define closed sets C_1, C_2, C_3, \ldots by

Theorem (Heine-Borel Theorem)

Notice that $C_{m+1} \subseteq C_m$ for all i.

Since they are non-empty, closed and bounded, the Cantor Intersection Theorem says $\bigcap_{m=1}^{\infty} C_m$ is non-empty.

Let $\vec{x} \in \bigcap_{m=1}^{\infty} C_m$.

Since $\vec{x} \in A \subseteq \bigcup_{i \in I} U_i$, we have that $\vec{x} \in U_k$ for some $k \in I$, meaning $\vec{x} \notin C_k$.

Theorem (Heine-Borel Theorem)

A subset $A \subseteq \mathbb{R}^n$ is compact if and only if it is closed and bounded.

Proof.

If C_m is empty for some m, then $\{U_1, \ldots, U_m\}$ covers A.

To prove this must happen, we assume otherwise.

Notice that $C_{m+1} \subseteq C_m$ for all i.

Since they are non-empty, closed and bounded, the Cantor Intersection Theorem says $\bigcap_{m=1}^{\infty} C_m$ is non-empty.

Let $\vec{x} \in \bigcap_{m=1}^{\infty} C_m$.

Since $\vec{x} \in A \subseteq \bigcup_{i \in I} U_i$, we have that $\vec{x} \in U_k$ for some $k \in I$, meaning $\vec{x} \notin C_k$.

This is a contradiction.
