#### Problem

Write down each of the following:

• the definition of an open cover of a set A

#### Problem

- the definition of an open cover of a set A
- a compact set

#### Problem

- the definition of an open cover of a set A
- a compact set
- Lindelöf Covering Theorem

#### Problem

- the definition of an open cover of a set A
- a compact set
- Lindelöf Covering Theorem
- Bolzano-Weierstrass Theorem

#### Problem

- the definition of an open cover of a set A
- a compact set
- Lindelöf Covering Theorem
- Bolzano-Weierstrass Theorem
- Cantor Intersection Theorem

#### Problem

- the definition of an open cover of a set A
- a compact set
- Lindelöf Covering Theorem
- Bolzano-Weierstrass Theorem
- Cantor Intersection Theorem
- Heine-Borel Theorem

#### Definition

#### Definition

#### Definition

$$d(x,x) = 0$$
 for all  $x \in M$ 

#### Definition

- d(x,x) = 0 for all  $x \in M$
- **positivity:** d(x,y) > 0 for all  $x, y \in M$  with  $x \neq y$

#### Definition

- d(x,x) = 0 for all  $x \in M$
- **@ positivity:** d(x,y) > 0 for all  $x, y \in M$  with  $x \neq y$
- **3 symmetry:** d(x,y) = d(y,x) for all  $x, y \in M$

#### Definition

- d(x,x) = 0 for all  $x \in M$
- **positivity:** d(x,y) > 0 for all  $x, y \in M$  with  $x \neq y$
- **8 symmetry:** d(x,y) = d(y,x) for all  $x, y \in M$
- triangle inequality:  $d(x, y) \le d(x, z) + d(z, y)$  for all  $x, y, z \in M$

#### Definition

A **metric space** is a pair (M, d) consisting of a nonempty set M of "points", along with a distance function  $d: M \times M \to \mathbb{R}$  with the following four properties.

- d(x,x) = 0 for all  $x \in M$
- **@ positivity:** d(x,y) > 0 for all  $x, y \in M$  with  $x \neq y$
- **Symmetry:** d(x,y) = d(y,x) for all  $x, y \in M$
- triangle inequality:  $d(x,y) \le d(x,z) + d(z,y)$  for all  $x, y, z \in M$

The value d(x, y) is called a **metric** and describes the "distance" between x and y.

# Open balls

### Open balls

#### Definition

Let (M, d) be a metric space. The open ball of radius r > 0 centered at  $x \in M$  is

$$B_M(x; r) = \{ y \in M : d(x, y) < r \}.$$

$$d_{\mathsf{eucl}}(\vec{x}, \vec{y}) = |\vec{x} - \vec{y}| = \sqrt{(x_1 - y_1)^2 + (x_2 - y_2)^2}$$

$$d_{\mathsf{eucl}}(\vec{x}, \vec{y}) = |\vec{x} - \vec{y}| = \sqrt{(x_1 - y_1)^2 + (x_2 - y_2)^2}$$

Euclidean metric (2-norm)

$$d_{\mathsf{eucl}}(\vec{x}, \vec{y}) = |\vec{x} - \vec{y}| = \sqrt{(x_1 - y_1)^2 + (x_2 - y_2)^2}$$

- Euclidean metric (2-norm)
- open balls are circles

$$d_{\mathsf{eucl}}(\vec{x}, \vec{y}) = |\vec{x} - \vec{y}| = \sqrt{(x_1 - y_1)^2 + (x_2 - y_2)^2}$$

- Euclidean metric (2-norm)
- open balls are circles

$$d_{\text{taxi}}(\vec{x}, \vec{y}) = |x_1 - y_1| + |x_2 - y_2|$$

$$d_{\mathsf{taxi}}(\vec{x}, \vec{y}) = |x_1 - y_1| + |x_2 - y_2|$$

Taxi-cab metric (1-norm, distances on city streets)

$$d_{\mathsf{taxi}}(\vec{x}, \vec{y}) = |x_1 - y_1| + |x_2 - y_2|$$

- Taxi-cab metric (1-norm, distances on city streets)
- open balls are diamonds

$$d_{\text{taxi}}(\vec{x}, \vec{y}) = |x_1 - y_1| + |x_2 - y_2|$$

- Taxi-cab metric (1-norm, distances on city streets)
- open balls are diamonds

$$d_{\infty}(\vec{x}, \vec{y}) = \max\{|x_1 - y_1|, |x_2 - y_2|\}$$

$$d_{\infty}(\vec{x}, \vec{y}) = \max\{|x_1 - y_1|, |x_2 - y_2|\}$$

Chebyshev metric (infinity norm)

$$d_{\infty}(\vec{x}, \vec{y}) = \max\{|x_1 - y_1|, |x_2 - y_2|\}$$

- Chebyshev metric (infinity norm)
- open balls are squares

$$d_{\infty}(\vec{x}, \vec{y}) = \max\{|x_1 - y_1|, |x_2 - y_2|\}$$

- Chebyshev metric (infinity norm)
- open balls are squares

$$d_p(\vec{x}, \vec{y}) = \sqrt[p]{|x_1 - y_1|^p + |x_2 - y_2|^p}$$

$$d_p(\vec{x}, \vec{y}) = \sqrt[p]{|x_1 - y_1|^p + |x_2 - y_2|^p}$$

• p-norm,  $1 \le p < \infty$ 

$$d_p(\vec{x}, \vec{y}) = \sqrt[p]{|x_1 - y_1|^p + |x_2 - y_2|^p}$$

- p-norm,  $1 \le p < \infty$
- open balls are rounded squares

$$d_p(\vec{x}, \vec{y}) = \sqrt[p]{|x_1 - y_1|^p + |x_2 - y_2|^p}$$

- *p*-norm,  $1 \le p < \infty$
- open balls are rounded squares

### Challenge!

Let M be a nonempty set and define  $d: M \times M \to \mathbb{R}$  by

$$d_{disc}(x,y) = \begin{cases} 1 & x \neq y \\ 0 & x = y \end{cases}$$

Let M be a nonempty set and define  $d: M \times M \to \mathbb{R}$  by

$$d_{\mathsf{disc}}(x,y) = \begin{cases} 1 & x \neq y \\ 0 & x = y \end{cases}$$

#### Problem

Prove that  $d_{\text{disc}}$  is a metric.

Let M be a nonempty set and define  $d: M \times M \to \mathbb{R}$  by

$$d_{\mathsf{disc}}(x,y) = \begin{cases} 1 & x \neq y \\ 0 & x = y \end{cases}$$

### **Problem**

Prove that  $d_{disc}$  is a metric.

This is called the **discrete metric**.

### Problem

What do the open balls with the discrete metric look like?

Definition

### Definition

Let (M, d) be a metric space and  $A \subseteq M$ .

### **Definition**

Let (M, d) be a metric space and  $A \subseteq M$ .

A point  $x \in M$  is called an **interior point** if there exists r > 0 such that  $B_M(x; r) \subseteq M$ .

#### Definition

Let (M, d) be a metric space and  $A \subseteq M$ .

A point  $x \in M$  is called an **interior point** if there exists r > 0 such that  $B_M(x; r) \subseteq M$ .

The set int(A) of interior points of A is called the **interior** of A.

#### Definition

Let (M, d) be a metric space and  $A \subseteq M$ .

A point  $x \in M$  is called an **interior point** if there exists r > 0 such that  $B_M(x; r) \subseteq M$ .

The set int(A) of interior points of A is called the **interior** of A. The set A is **open** if every point in A is an interior point, or equivalently int(A) = A.

### Problem

Consider the metric space  $(\mathbb{R}, d_{\text{disc}})$  where  $d_{\text{disc}}$  is the discrete metric.

What sets are open sets?

Definition

### Definition

Let (M, d) be a metric space and  $A \subseteq M$ .

### **Definition**

Let (M, d) be a metric space and  $A \subseteq M$ .

A set  $A \subseteq M$  is closed if the complement  $M \setminus A$  is open.

### Definition

Let (M, d) be a metric space and  $A \subseteq M$ .

A set  $A \subseteq M$  is closed if the complement  $M \setminus A$  is open.

A point  $x \in M$  is an **adherent point** if for all r > 0 the ball  $B_M(x; r)$  contains an element of M.

#### Definition

Let (M, d) be a metric space and  $A \subseteq M$ .

A set  $A \subseteq M$  is closed if the complement  $M \setminus A$  is open.

A point  $x \in M$  is an **adherent point** if for all r > 0 the ball  $B_M(x; r)$  contains an element of M.

A point  $x \in M$  is an **accumulation point** if for all r > 0 the ball

 $B_M(x; r)$  contains an element of M different from x.

#### Definition

Let (M, d) be a metric space and  $A \subseteq M$ .

A set  $A \subseteq M$  is closed if the complement  $M \setminus A$  is open.

A point  $x \in M$  is an **adherent point** if for all r > 0 the ball  $B_M(x; r)$  contains an element of M.

A point  $x \in M$  is an **accumulation point** if for all r > 0 the ball

 $B_M(x; r)$  contains an element of M different from x.

The set  $\overline{M}$  of all adherent points of M is called the **closure** of M.

### Problem

Consider the metric space  $(\mathbb{R}, d_{\text{disc}})$  where  $d_{\text{disc}}$  is the discrete metric.

Which sets are closed?

### Problem

Prove the following (Apostol Theorem 3.36). If (M, d) is a metric space,  $U \subseteq M$  is open, and  $C \subseteq M$  is closed, then  $U \setminus C$  is open and  $C \setminus U$  is closed.

### Theorem (Apostol Theorem 3.37)

### Theorem (Apostol Theorem 3.37)

Let (M, d) be a metric space and  $A \subseteq S$ . Then the following are equivalent:

A is closed

### Theorem (Apostol Theorem 3.37)

- A is closed
- A contains all of its adherent points

### Theorem (Apostol Theorem 3.37)

- A is closed
- A contains all of its adherent points
- A contains all of its accumulation points

### Theorem (Apostol Theorem 3.37)

- A is closed
- A contains all of its adherent points
- A contains all of its accumulation points
- $\bigcirc$   $A = \overline{A}$

### Theorem

Let (M, d) be a metric space and  $\{U_i : i \in I\}$  be a family of open sets in M. The union  $\bigcup_{i \in I} U_i$  is open.

### Theorem

Let (M, d) be a metric space and  $\{U_i : i \in I\}$  be a family of open sets in M. The union  $\bigcup_{i \in I} U_i$  is open.

### Proof.

Identical to the proof for  $\mathbb{R}^n$ .

#### Theorem

Let (M, d) be a metric space and  $\{U_i : i \in I\}$  be a family of open sets in M. The union  $\bigcup_{i \in I} U_i$  is open.

### Proof.

Identical to the proof for  $\mathbb{R}^n$ .

#### Theorem

Let (M, d) be a metric space and  $U_1, U_2, \ldots, U_n$  be open sets in M. The intersection  $\bigcap_{i=1}^n U_i$  is open.

#### **Theorem**

Let (M, d) be a metric space and  $\{U_i : i \in I\}$  be a family of open sets in M. The union  $\bigcup_{i \in I} U_i$  is open.

### Proof.

Identical to the proof for  $\mathbb{R}^n$ .

### Theorem

Let (M, d) be a metric space and  $U_1, U_2, \ldots, U_n$  be open sets in M. The intersection  $\bigcap_{i=1}^n U_i$  is open.

### Proof.

Identical to the proof for  $\mathbb{R}^n$ .

### Theorem

Let (M, d) be a metric space and  $\{C_i : i \in I\}$  be a family of closed sets in M. The intersection  $\bigcap_{i \in I} C_i$  is closed.

### Theorem

Let (M, d) be a metric space and  $\{C_i : i \in I\}$  be a family of closed sets in M. The intersection  $\bigcap_{i \in I} C_i$  is closed.

### Proof.

Apply De Morgan's Laws.

#### Theorem

Let (M, d) be a metric space and  $\{C_i : i \in I\}$  be a family of closed sets in M. The intersection  $\bigcap_{i \in I} C_i$  is closed.

#### Proof.

Apply De Morgan's Laws.

#### Theorem

Let (M, d) be a metric space and  $C_1, C_2, \ldots, C_n$  be closed sets in M. The intersection  $\bigcup_{i=1}^n C_i$  is closed.

#### Theorem

Let (M, d) be a metric space and  $\{C_i : i \in I\}$  be a family of closed sets in M. The intersection  $\bigcap_{i \in I} C_i$  is closed.

### Proof.

Apply De Morgan's Laws.

#### Theorem

Let (M, d) be a metric space and  $C_1, C_2, ..., C_n$  be closed sets in M. The intersection  $\bigcup_{i=1}^n C_i$  is closed.

### Proof.

Apply De Morgan's Laws.

## Outline

- Real Analysis Lecture 12
  - Metric Spaces
  - Subspaces

# Metric subspace

### Definition

Let (M, d) be a metric space.

# Metric subspace

### **Definition**

Let (M, d) be a metric space.

If  $S \subseteq M$  is a subset, then  $d : M \times M \to \mathbb{R}$  restricts to a metric  $d : S \times S \to \mathbb{R}$ , called the **relative metric**.

# Metric subspace

#### **Definition**

Let (M, d) be a metric space.

If  $S \subseteq M$  is a subset, then  $d : M \times M \to \mathbb{R}$  restricts to a metric  $d : S \times S \to \mathbb{R}$ , called the **relative metric**.

The space (S, d) with the relative metric is called a **metric** subspace.

# Metric subspace

#### **Definition**

Let (M, d) be a metric space.

If  $S \subseteq M$  is a subset, then  $d : M \times M \to \mathbb{R}$  restricts to a metric  $d : S \times S \to \mathbb{R}$ , called the **relative metric**.

The space (S, d) with the relative metric is called a **metric** subspace.

Open balls in S:

$$B_{\mathcal{S}}(x;r) = B_{\mathcal{M}}(x;r) \cap \mathcal{S}.$$

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

#### Proof.

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

### Proof.

 $\Longrightarrow$ : Assume *V* is an open subset of *S*.

### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

### Proof.

 $\Longrightarrow$ : Assume *V* is an open subset of *S*.

Then for all  $x \in V$ , there exists  $r_x > 0$  such that  $B_S(x; r_x) \subseteq V$ .

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

### Proof.

 $\implies$ : Assume *V* is an open subset of *S*.

Then for all  $x \in V$ , there exists  $r_x > 0$  such that  $B_S(x; r_x) \subseteq V$ .

This says  $B_M(x; r_x) \cap S \subseteq V$ .

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

### Proof.

 $\implies$ : Assume *V* is an open subset of *S*.

Then for all  $x \in V$ , there exists  $r_x > 0$  such that  $B_S(x; r_x) \subseteq V$ .

This says  $B_M(x; r_x) \cap S \subseteq V$ .

Define

$$U=\bigcup_{x\in V}B_M(x;r_x).$$

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

### Proof.

 $\Longrightarrow$ : Assume *V* is an open subset of *S*.

Then for all  $x \in V$ , there exists  $r_x > 0$  such that  $B_S(x; r_x) \subseteq V$ .

This says  $B_M(x; r_x) \cap S \subseteq V$ .

Define

$$U=\bigcup_{x\in V}B_M(x;r_x).$$

This is a union of open sets, and is therefore open.

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

### Proof.

 $\implies$ : Assume *V* is an open subset of *S*.

Then for all  $x \in V$ , there exists  $r_x > 0$  such that  $B_S(x; r_x) \subseteq V$ .

This says  $B_M(x; r_x) \cap S \subseteq V$ .

Define

$$U=\bigcup_{x\in V}B_M(x;r_x).$$

This is a union of open sets, and is therefore open.

Furthermore  $U \cap S = V$ .

### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

#### Proof.

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

#### Proof.

 $\Leftarrow$ : Assume *U* is an open subset of *M*.

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

### Proof.

 $\Leftarrow$ : Assume *U* is an open subset of *M*.

We need to show that  $V := U \cap S$  is open.

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

### Proof.

 $\Leftarrow$ : Assume *U* is an open subset of *M*.

We need to show that  $V := U \cap S$  is open.

If  $x \in V$ , then  $x \in U$  and there exists r > 0 such that

 $B_M(x;r) \subseteq U$ .

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

### Proof.

 $\Leftarrow$ : Assume *U* is an open subset of *M*.

We need to show that  $V := U \cap S$  is open.

If  $x \in V$ , then  $x \in U$  and there exists r > 0 such that

 $B_M(x;r)\subseteq U$ .

It follows that  $B_S(x,r) = B_M(x,r) \cap S \subseteq U \cap S = V$ .

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

### Proof.

 $\Leftarrow$ : Assume *U* is an open subset of *M*.

We need to show that  $V := U \cap S$  is open.

If  $x \in V$ , then  $x \in U$  and there exists r > 0 such that

 $B_M(x;r)\subseteq U.$ 

It follows that  $B_S(x,r) = B_M(x,r) \cap S \subseteq U \cap S = V$ .

This shows that x is an interior point of S in the metric subspace (S, d).

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then V is an open subset of S if and only if there exists an open subset U of M with  $V = U \cap S$ .

### Proof.

 $\Leftarrow$ : Assume *U* is an open subset of *M*.

We need to show that  $V := U \cap S$  is open.

If  $x \in V$ , then  $x \in U$  and there exists r > 0 such that

 $B_M(x;r)\subseteq U$ .

It follows that  $B_S(x,r) = B_M(x,r) \cap S \subseteq U \cap S = V$ .

This shows that x is an interior point of S in the metric subspace (S, d).

Since  $x \in V$  was arbitrary, this shows that V is open in S.

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then B is a closed subset of S if and only if there exists a closed subset A of M with  $B = A \cap S$ .

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then B is a closed subset of S if and only if there exists a closed subset A of M with  $B = A \cap S$ .

### Proof.

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then B is a closed subset of S if and only if there exists a closed subset A of M with  $B = A \cap S$ .

### Proof.

Let  $B \subseteq S$ .

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then B is a closed subset of S if and only if there exists a closed subset A of M with  $B = A \cap S$ .

#### Proof.

Let  $B \subseteq S$ .

B is closed in S if and only if  $S \setminus B$  is open in B

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then B is a closed subset of S if and only if there exists a closed subset A of M with  $B = A \cap S$ .

#### Proof.

Let  $B \subseteq S$ .

B is closed in S if and only if  $S \setminus B$  is open in B. This is true if and only if there exists an open subset U of M with  $S \setminus B = U \cap S$ .

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then B is a closed subset of S if and only if there exists a closed subset A of M with  $B = A \cap S$ .

#### Proof.

Let  $B \subseteq S$ .

B is closed in S if and only if  $S \setminus B$  is open in B

This is true if and only if there exists an open subset U of M with  $S \setminus B = U \cap S$ .

This is true if and only if there exists an open subset U of M with  $B = (M \setminus U) \cap S$ .

#### Theorem

Let (M, d) be a metric space and let (S, d) be a subspace. Then B is a closed subset of S if and only if there exists a closed subset A of M with  $B = A \cap S$ .

### Proof.

Let  $B \subseteq S$ .

B is closed in S if and only if  $S \setminus B$  is open in B

This is true if and only if there exists an open subset U of M with  $S \setminus B = U \cap S$ .

This is true if and only if there exists an open subset U of M with  $B = (M \setminus U) \cap S$ .

this is true if and only if there exists a closed subset A of M with  $B = A \cap S$ .

Consider the metric space  $(\mathbb{R}, d)$  with  $d = d_{\text{eucl}}$  the Euclidean metric, and the metric subspace (S, d) for S = [0, 1].

• [0, 1] is open in S and closed in S, but it is not open in M

- [0, 1] is open in S and closed in S, but it is not open in M
- [0, 1/2) is open in S, but not in M

- [0, 1] is open in S and closed in S, but it is not open in M
- [0, 1/2) is open in *S*, but not in *M*
- (0, 1/2) is open in both S and in M

- [0, 1] is open in S and closed in S, but it is not open in M
- [0, 1/2) is open in S, but not in M
- (0, 1/2) is open in both S and in M
- (1/2, 1] is open in S, but not in M
